1. Compensation Unit Workflow

Handles Government Acquisition, Compensation, and Occupancy Permit (OP) Generation.

Phase 1: File Commissioning & Records Management

- Records Section: Retrieves and curates the CO (Compensation Files) files. Logs Allocation Records and conducts OP Verification.
- Project Management Section: Commissions the CO files for the specific government acquisition project. Maintains the master record of all active projects.

Phase 2: Compensation Case Processing

- Compensation Cases Section:
  - Registers the compensation case.
  - Captures the list of Beneficiaries.
  - Logs the Economic Trees List and asset valuation.
- Fieldwork Execution (Mobile App 1): Field officers deploy the Compensation Cases Mobile App to conduct on-site fieldwork, capturing geo-tagged photos of assets, verifying economic trees, and recording beneficiary data offline/online. Data auto-syncs to the Compensation Cases Section.

Phase 3: OP Allocation & Dispute Resolution

- OP Allocation Section: Upon successful compensation and asset verification, the system generates the Occupancy Permits (OPs) for the affected beneficiaries.
- Complaints Section: Handles and logs any grievances or disputes arising from the compensation or OP allocation process.

. GKN Unit Workflow (Government Files Only)

Handles Government layouts, LPKN, LPPL, Misc KN, and Government Survey nstructions.

Phase 1: File Reception & Layout Planning

- Sections (LPKN, LPPL, Misc KN): Receives and categorizes government land files.
- Layout Planning: Creates and curates the digital Layout Plans for the government project.

Phase 2: Survey Instruction & Field Execution

- Instruction to Survey (I to S): Generates and curates the official Instruction to Survey specifically for Government Surveyors.
- Field Execution (Mobile App 2): Government Surveyors deploy the Field Observations Mobile App to conduct the physical survey, capturing field notes, coordinates, and boundary observations. Data syncs back to the GKN Unit.

Phase 3: Computation & Reporting

- Computation Field Observations: Processes the raw field data from the mobile app for both Government and Private acquisitions.
- List of Coordinates: Generates and stores the official list of coordinates for the surveyed layout.
- Surveyors Report: Generates, curates, and archives the final Surveyors Report for the government project.

3. Geo-Informatics Unit Workflow

Handles the purely geospatial and spatial data aspects of the Survey Department.

...tools and generates the Plot

Phase 1: Spatial Data Preparation

- Tools & Plot Allocation: Manages system GIS tools and g... Allocation List based on the approved layouts.

Phase 2: Plan Generation & Extraction

- Application Plan: Generates the initial Application Survey Plan based on the plot allocation.
- Final Survey Plan: Processes the final spatial data to generate the definitive Final Survey Plan.
- Survey Plan Extraction: Extracts and exports the finalized digital survey plans in required formats (PDF, DWG, Shapefile) for integration with KLAES-GIS (KANGIS) and the Cadastral Department.

4. Examination/Verification Unit Workflow

Handles the quality assurance, verification, and boundary management for files from Cadastral and internal Government files.

Phase 1: File Registration & Verification

- File Registration: Receives and registers files sent from the Cadastral Department or internal GKN files for verification.
- Old Surveys Verification: Cross-references the submitted survey against existing/historical survey records in the system.

Phase 2: Dispute & Control Management

- Boundary Dispute: Records and logs any boundary disputes identified during the verification process.
- Survey Control Points: Curates and manages the official Survey Control Points used for geodetic referencing.

Phase 3: Beacon Generation & Final Reporting

- Beacon & Coordinate Generation: Generates the official Beacons and validates the coordinates. Updates the Digital Beacon Register.

Surveyors Report (Changes): If discrepancies are found between the submitted plan and the existing records, this unit generates and prints a Surveyors Report detailing the required changes.

Final Clearance: Once verified and cleared, the file is routed back to the Cadastral Department or the respective requesting unit.

ITAL SURCON BEACON REGISTER

low is the digitized structure of the Surcon Beacon Register based on your physical cument. In the KLAES-CORE system, this will be an automated, digital ledger where ntries are auto-populated when beacons are generated by the xamination/Verification Unit.

SURCON BEACON REGISTER (No. 201845)

Quarter: [Select Quarter] | **Month:** [Select Month] | **Total Number Issued Per Page:** [Auto-calculated]

TE	ISSUED NUMBER	PLAN NO	SURVEYOR'S NAME	REGIS TRATION	LOCA TION	TELLER NO	AMOUNT (₦)	DATE RECEIVED	SIGN ATURE	REM ARK

(System Note: The table will dynamically expand as new beacons are issued. "Total Number Issued Per Page" will auto-update based on the rows populated.)

AUTHORIZATION & AUDIT TRAIL

Role	Name	Date	Signature
ENTERED BY	_____	_____	[Digital Signature/Initials]
REVIEWED BY	_____	_____	[Digital Signature/Initials]
AUDITED BY	_____	_____	[Digital Signature/Initials]

CORE System Implementation Notes for the Beacon Register:

Auto-Population: When the Examination/Verification Unit generates a Beacon in the system, the ISSUED NUMBER, PLAN NO, SURVEYOR'S NAME, LOCATION, and AMOUNT should automatically pull from the linked Survey File and Payment (Rev-M) module.

2. **Digital Signatures:** The "Signature" column in the main table and the footer will utilize the **KLAES-CONTROL** digital signatory module. Officers will authenticate via 2FA/Biometrics to "sign" the register.

3. **Audit Trail:** The "Entered By", "Reviewed By", and "Audited By" sections will automatically log the User ID, Timestamp, and IP address of the officers who approve the page, replacing the need for physical signing.

4. **Export & Print:** The system must allow the Registry/Records section to export this digital register into a PDF format that perfectly mimics the physical layout for official archiving or external audits.

CORE System Implementation Notes for the Beacon Register:

Auto-Population: When the Examination/Verification Unit generates a Beacon in the system, the ISSUED NUMBER, PLAN NO, SURVEYOR'S NAME, LOCATION, and AMOUNT should automatically pull from the linked Survey File and Payment (Rev-M) module.
